SUMMARY

Platform and DevOps engineer with 10+ years across AWS, Azure, and GCP. I build the systems other engineers ship through: the Terraform GitOps pipeline my DevOps org runs on, multi-cluster Kubernetes on ArgoCD, and a regulated fintech wallet platform built from zero. A QA background left me with a bias toward reliability, and toward alerting that only fires when it carries information.

CORE SKILLS

Platform & Orchestration	Kubernetes (AKS, GKE, EKS), ArgoCD, Argo Rollouts, Argo Workflows, Kargo, Helm, OLM, Karpenter, KEDA
IaC & CI/CD	Terraform, Terragrunt, Crossplane, GitLab CI, GitOps pipeline design, progressive delivery
Security & Networking	HashiCorp Vault, External Secrets Operator, Kong, Keycloak, Cloudflare WAF, mTLS, SOC2, Azure HSM
Observability	Datadog, Prometheus, Grafana, SLO-gated canary analysis, alert-noise reduction
Languages	Python, Go, Bash, KCL

EXPERIENCE

Senior DevOps Engineer · HAAT Delivery

Nov 2025 – Present

GitOps, platform architecture, and cloud infrastructure across a multi-cluster Kubernetes estate: delivery logistics and a regulated fintech wallet.

- **Built the Terraform GitOps pipeline the DevOps org runs on.** Native Terragrunt change detection so an MR plans only the stacks it touches, prod/dev runner isolation, Vault AppRole auth replacing static tokens, automated MR labelling. Built in the original Terragrunt repo, carried into its successor when that was seeded, still in use across 56 live stacks and 14 environments on Azure and GCP.
- **Drift detection:** daily scan of every live stack into one Slack summary, gated to fail the pipeline on plan errors, with state-diff suppression so an unchanged set stays silent and a post always means something moved.
- **Built the regulated fintech wallet platform from zero** and still own it: Kong ingress, Keycloak SSO, JWT signing keys in an Azure HSM, namespace-scoped secrets via Vault and External Secrets, progressive delivery on Argo Rollouts with SLO-gated canary analysis. Delivered inside bank-partner approval gates, with an external payment partner integrated behind mTLS.
- **Developer experience:** replaced a monolithic ArgoCD deployment model with per-domain Applications and ApplicationSets, giving QA isolated ephemeral PR environments instead of one shared staging queue.
- **Cut roughly 290 false pages in two months** by making platform alerts deployment-immune, so on-call attention goes to real incidents.
- **Operator platform:** split a monolithic OLM chart on the Suhail GKE clusters into per-operator subscriptions, with an Argo Workflow for zero-downtime recovery from stuck CSVs.
- Drive architecture decisions with backend leads and own the resulting engineering contracts, including release/version ownership and safe database-migration sequencing.

DevOps Engineer · Beamr

Apr 2023 – Nov 2025

AWS infrastructure for a serverless-heavy video and AI product, evolved from a basic Lambda setup to a full Kubernetes platform with GPU acceleration.

- **Cut compute cost 70%** by moving a monolithic architecture to KEDA-autoscaled Kubernetes microservices on GPU spot instances.
- Migrated workloads off AWS Batch to Kubernetes with Karpenter, and built the IaC stack on Crossplane (Go, KCL) where Terraform did not fit the use case.
- **Led the company to SOC2 certification on the first attempt**, owning the infrastructure security roadmap.
- Replaced CloudWatch and ELK with Datadog for observability that produced actionable signal.

Infrastructure & Automation Engineer · BMC Software

Mar 2017 – Apr 2023

- **Infrastructure Engineer** (Jul 2021 – Apr 2023): built and operated infrastructure and IaC for enterprise on-prem and SaaS products.
- **Automation Engineer** (Mar 2017 – Jul 2021): designed an object-oriented automation framework to provision high-scale endurance test environments, replacing manual setup with repeatable builds. Used deep OSI-model networking expertise to resolve critical infrastructure bottlenecks.

QA Engineer · Galil Software

Oct 2015 – Mar 2017

- Functional, regression, and performance testing across cross-functional teams. Where the reliability-first mindset came from.

EDUCATION, CERTIFICATIONS & LANGUAGES

B.Sc Industrial Engineering, Technion 2010–2014 · AWS Certified Cloud Practitioner · ISTQB Level 1 & 2
